NalaWatch

Title

? AI-first urban flood intelligence for Indian cities

? Predicting waterlogging before it becomes a crisis

? Mission: help citizens, civic teams, and responders act before disaster strikes.

Problem

Problem

? Monsoon rainfall overwhelms aging drainage networks.

? Waterlogging and drain overflow create health risks, mobility loss, and massive economic damage.

? India loses ~$4B annually; projected to rise to $5B by 2030.

Why current systems fail

Why

? Reactive city response after flooding begins.

? Fragmented data: weather, GIS, sensor feeds, and citizen reports are not unified.

? No real-time flood intelligence layer for action and prioritization.

Solution

Solution

? NalaWatch ingests weather forecasts, historical flooding, and IoT sensor data.

? AI scores high-risk hotspots and simulates likely overflow events.

? Civic teams get early warnings and intervention guidance before the crisis.

Product

Product

? Live risk dashboard

? Hotspot map with flood probability and impact score

? Alerts for authorities, responders, and residents

? Actionable playbooks and escalation recommendations

Market

Market

? Target: tier-1 and tier-2 Indian cities

? Use cases: disaster management, municipal operations, mobility planning, public health.

? Business model: SaaS subscriptions + public-sector pilots + data partnerships.

Traction

Traction

? Prototype landing page and product concept validated by hackathon problem framing.

? Potential early pilots with municipal stakeholders and mobility teams.

? Scalable across climate resilience, public works, and infrastructure intelligence.

Ask

Ask

? $10K prize + incubation support for prototype, pilot validation, and partnership outreach.

? We are building the AI core, deployment path, and first-city pilot strategy.

? Goal: become the trusted flood intelligence layer for India?s urban resilience.
